"III-nitrides on silicon: a platform for integrated photonics from the ultraviolet to the near-infrared "

Jury members :

Nicolas GRANDJEAN, Pr, EPFL, Rapporteur & Examinateur
Alfredo DE ROSSI, HdR, Ingénieur TRT, Rapporteur & Examinateur
Maria TCHERNYCHEVA, DR, CNRS, C2N, Examinatrice
Michael KNEISL, Pr, TU Berlin, Examinateur
Yannick DUMEIGE, MC, HdR, Institut Foton, Examinateur
Philippe BOUCAUD, DR, CNRS, CRHEA, Directeur de thèse
Bruno GAYRAL, Ingénieur HdR, CEA, IRIG, Co-Encadrant

Abstract :

III-nitride semiconductors (AlN, GaN, InN and their alloys) have become an integral part of our daily lives as they are used in white, blue, green, and ultraviolet light emitting diodes, as well as laser diodes, and power and high frequency electronics. This material is highly versatile due to its tuneable large direct band gap from the ultraviolet to the visible. III-nitrides give access to a very wide range of electronic, optoelectronic, and photonic applications. In photonics, a promising field relies on the III-nitride on silicon platform for next generation photonic integrated circuits due to its large transparency window from the ultraviolet to the near-infrared and the possibility of monolithic integration of active emitters such as quantum wells or quantum dots.

In this thesis, we study microdisk resonators and lasers and their integration into active photonic circuits in the ultraviolet and visible spectral range. We demonstrate low threshold pulsed optically pumped lasing in microdisks, the first active microlaser photonic circuits in the blue and ultraviolet spectral ranges, as well as critical coupling in the blue spectral range. We also propose a scheme for electrical injection in microrings that is compatible with photonic circuits. Finally, we give an outlook of on-going work with photonic circuits in the near-infrared as well as ways to improve electrical injection in the blue spectral range.

A votre arrivée merci de vous présenter à l'accueil muni(e) d'une pièce d'identité
